

Results Handling Tips & Tricks

If your query isn't working using the term "complete blood count" try using "full blood count"

Once you've imported the query you need to open it up and change the date parameter to the previous month (this will need to occur each time you run it) e.g.
between 01/08/18 and 29/08/18 this should capture all the FBC results between this period. If you are finding there isn't 10 then use another measure e.g. LFT (a new query will need to be created for this)
